What are algal blooms?  
What makes them harmful?
There are many species of single-celled organisms living in the Great Lakes, including algae. When certain conditions are present, such as high nutrient or light levels, these organisms can reproduce rapidly. This dense population of algae is called a bloom. Some of these blooms are harmless, but when the blooming organisms contain toxins, other noxious chemicals, or pathogens, it is known as a harmful algal bloom, or HAB. HABs can cause the death of nearby fish and foul up nearby coastlines, and produce harmful conditions to marine life as well as humans.

Are all algae poisonous?  
What species are poisonous?
Algae are a natural part of our waterways. There are many species of algae, and most do not produce toxins. However, all blue-green algae, or cyanobacteria, can produce skin irritants under certain conditions, and some can produce multiple types of the more harmful toxins. The most common species of toxic cyanobacteria in the Great Lakes are:

- Microcystis aeruginosa
- Anabaena circinalis
- Anabaena flos-aquae
- Aphanizomenon flos-aquae
- Cylindrospermopsis raciborskii

Blue-green algal bloom in Lake Erie on the shore of Catawaba Island, Ohio in summer 2009.

Blue-green algal bloom in Lake Erie as seen from the MODIS satellite on August 4, 2014 when approx. 400,000 people in Toledo, were warned not to drink their tap water after high levels of Microcystis was discovered in the water supply.

Toxins Produced by blue green algae

Blue-green algae can produce a wide array of neurotoxins, liver toxins (hepatotoxins), cell toxins, and skin irritants. Neurotoxins include anatoxin-a, anatoxin-a(s) and saxitoxin, and are commonly produced by the *Anabaena* and *Oscillatoria* species. Consumption of large amounts of these toxins by animals or humans can result in muscle cramps, twitching, paralysis, and cardiac or respiratory failure.

Hepatotoxins (liver toxins) include microcystin and cylindrospermopsin, and are produced by the *Microcystis* and *Cylindrospermopsis* species. These toxins produce symptoms including nausea, vomiting, and acute liver failure.

Dermatotoxins (skin irritants) include aplysiatoxin, lyngbiatoxin-a, and lipopolysaccharides. Nearly all blue-green algae produce dermatotoxins. These toxins produce symptoms including skin irritation, rashes, and gastrointestinal distress. Sensitivity to these toxins varies widely among individuals.

**The Do’s and Don’ts of HABs**

- **Do** avoid contact with water where algae are visible (e.g. pea soup, floating mats, scum layers, etc), or where water is discolored.
- **Do** rinse yourself and/or your pet off after swimming in any ponds, lakes or streams, regardless of the presence of a visible algal blooms.
- **Do** obey posted signs for beach closings.
- **Do** contact your local health department or department of natural resources to report any large blooms.
- **Don’t** drink untreated surface water, whether or not blooms are present. Remember, **BOILING THE WATER WILL NOT REMOVE THE TOXINS.**
- **Don’t** use algaecides to kill the cyanobacteria– when the cells die, the toxins are directly released into the water.
- **Don’t** allow children or pets to play in or drink water where scum is present.
- **Don’t** water-ski or jet-ski over algal mats.
- **Don’t** irrigate lawns or golf courses with water that looks or smells bad.

**Health Risks Associated with Beach Contaminants**

- Headache, parasthesia, numbness
- Ear, nose, and throat irritation
- Skin irritation or rash
- Cardiac or respiratory failure (rare)
- Liver enlargement or failure (rare)
- Nausea, vomiting, and diarrhea
